1. 制造汽车的时间

A line graph shows the amount of time to produce a vehicle by four US car manufacturers between 1998 and 2005.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant.

Write at least 150 words.

The line graph illustrates the average hours taken to produce vehicles by four major car manufacturers—General Motors, Ford, Toyota, and Honda—in the US from 1998 to 2005.

Overall, while all manufacturers reduced their production times over the years, Honda consistently remained the most efficient, followed by Toyota, General Motors and Ford.

General Motors started with the highest production time at approximately 32 hours per vehicle in 1998, but this figure gradually decreased to around 22 hours by 2005. In contrast, Honda consistently maintained the lowest production times, starting at about 22 hours and reducing it further to 20 hours by 2005, showcasing its efficiency.

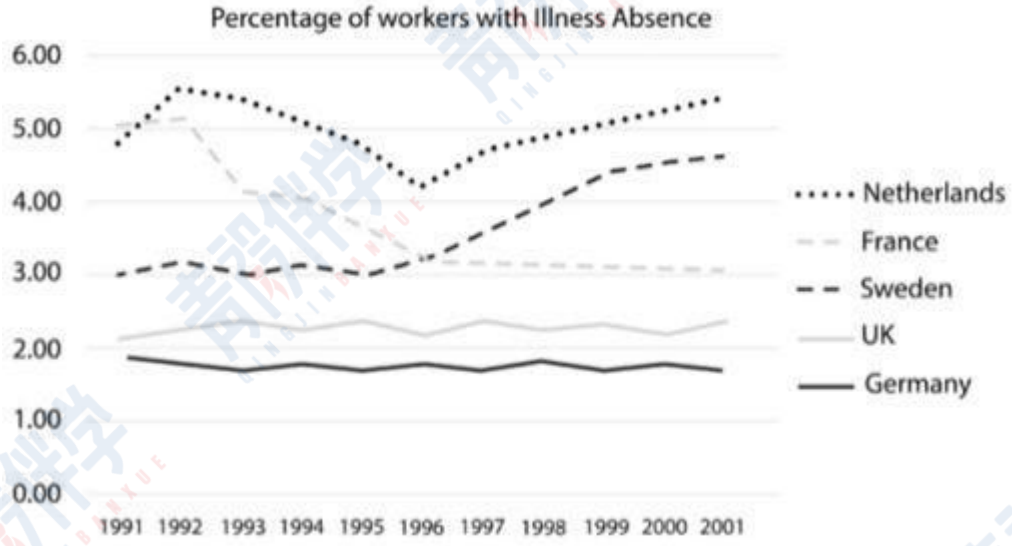

Ford and Toyota showed similar trends in production hours. Ford's production time fluctuated between 22 and 31 hours over the years, ending at around 22 hours in 2005. Meanwhile, Toyota improved from approximately 22 hours in 1998 to about 20 hours in 2005, indicating a steady enhancement in efficiency.

2. 欧洲国家工人因病缺勤情况

The graph below shows the percentage of workers from five different European countries that were absent for five days or more due to illness per year from 1991 to 2001.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant.

Write at least 150 words.

The graph gives information relating to the percentage of people that were absent from work due to sickness for one or more days from 1991 to 2001.

Overall, the Netherlands had the highest rate of people taking leave from work due to illness in almost all years of the study, while Germany had the lowest rate.

In 1991, around 5% of the workforce from both the Netherlands and France were off from work for a day or more due to sickness. By 1996, the percentage of workers who had taken sick leave had dropped to around 4% in the Netherlands, and just over 3% in France. While this figure
stabilised at around 3% over the remaining years in France, the percentage of workers taking sick days in the Netherlands bounced back up to around 5.5% by 2001.

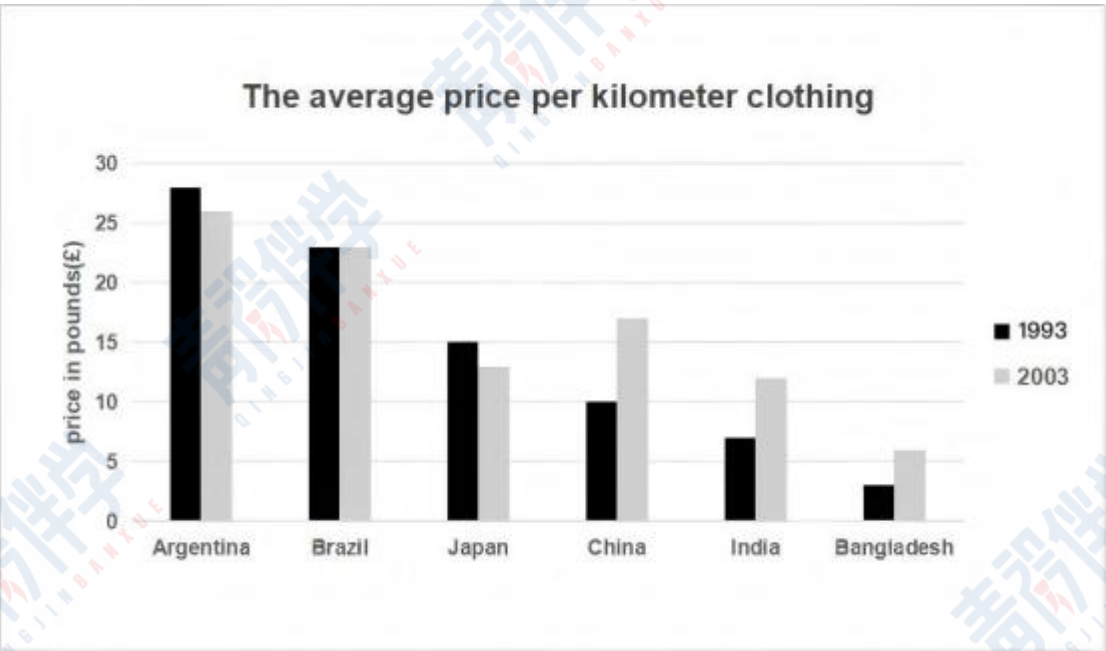

Meanwhile, the percentage of workers taking sick days in Sweden rose from 3% in 1991 to over 4.5% in 2001. Additionally, while the percentage of workers taking sick days in the UK hovered slightly above 2% over the period, the figure for Germany remained at just under 2% over the
entire period.

3. 欧盟进口服装价格

The bar chart shows the average prices per kilometre of clothing imported into the European Union from six different countries in 1993 and 2003.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant.

Write at least 150 words.

The bar chart illustrates the prices per kilometre of clothing imported into the European Union from six different countries—Argentina, Brazil, Japan, China, India, and Bangladesh—in the years 1993 and 2003.

Overall, Argentina commanded the highest prices per kilometre of clothing in both years, while Bangladesh had the lowest.

In 1993, Argentina led with approximately £28 per kilometre of exported clothing, slightly higher than the roughly £23 paid to Brazil. Japan, in the same year, received a steady £15 per kilometre, while the EU paid £10 to China. India and Bangladesh were paid the least, with figures around £7 and £3, respectively.

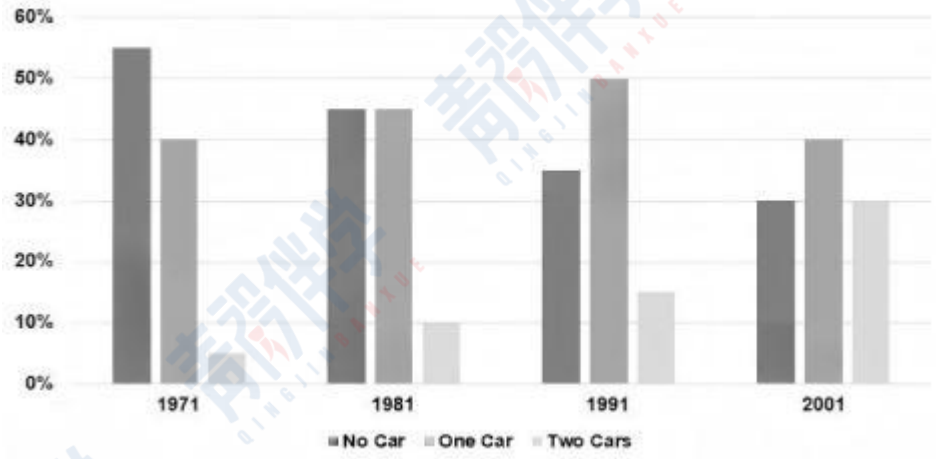

By 2003, although Argentina's import price had dropped to just over £25, it remained the highest among the six countries. Brazil's price remained stable, close to £23. Interestingly, China saw a considerable increase to approximately £17, surpassing Japan, whose import price fell slightly to £13. India's price increased to £12, showing a notable growth, while Bangladesh's price also rose, reaching £6.

4. 家庭用车

The graph below provides information on car ownership by UK households between 1971 and 2001.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant.

Write at least 150 words.

The bar chart compares the proportion of households with no car, one car, and two cars in the years 1971, 1981, 1991, and 2001.

Overall, there was a clear shift towards greater car ownership over the 30-year period. The percentage of households without a car declined steadily, while ownership of two cars grew significantly. One-car households remained the most common for most of the period but showed some fluctuation.

The proportion of households without a car experienced a marked decline. In 1971, over half of all households (55%) did not own a vehicle. This figure fell sharply to 45% in 1981 and continued to decline, reaching 35% by 1991. By 2001, the percentage had dropped further to just 30%, reflecting improved access to private transport over time.

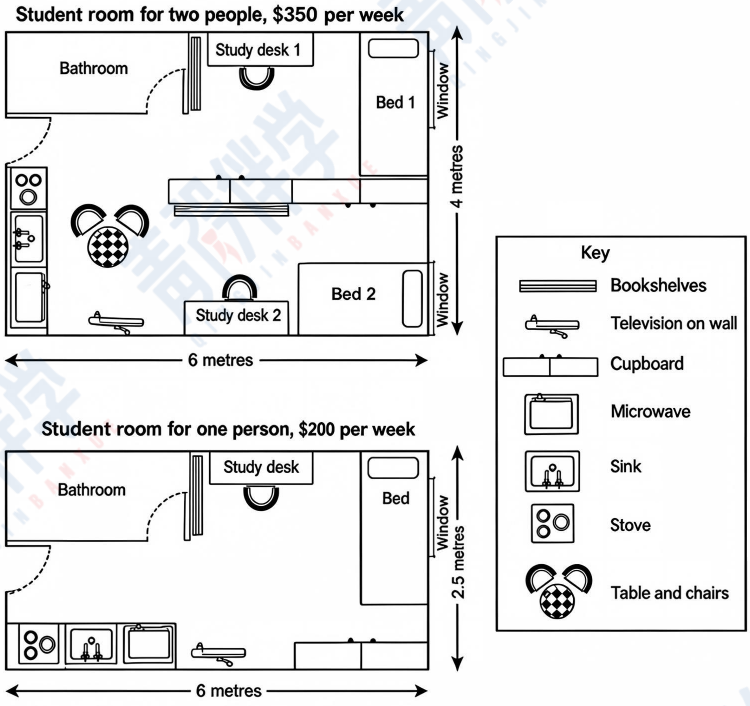

Households with one car represented 40% in 1971, rising to 45% in 1981 and peaking at 50% in 1991. However, this figure declined slightly to 40% by 2001, possibly due to a growing number of families owning two vehicles. Indeed, ownership of two cars increased steadily throughout the period—from a modest 5% in 1971 to 10% in 1981, then to 15% in 1991, and finally reaching 30% by 2001, matching the figure for households with no car.

5. 澳大利亚学生宿舍

The plans below show a student room for two people and a student room for one person at an Australian university.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant.

Write at least 150 words

The two floor plans compare a double student room and a single student room at an Australian university.

Overall, the double room is wider and more expensive, featuring shared amenities, whereas the single room is narrower, cheaper, and offers a more streamlined layout with fewer items of furniture.

Both accommodation types share the same length of 6 metres and feature a bathroom in the northwest corner. However, the double room measures 4 metres in width and costs $350 per week, whereas the single room is 2.5 metres wide with a weekly rent of $200.

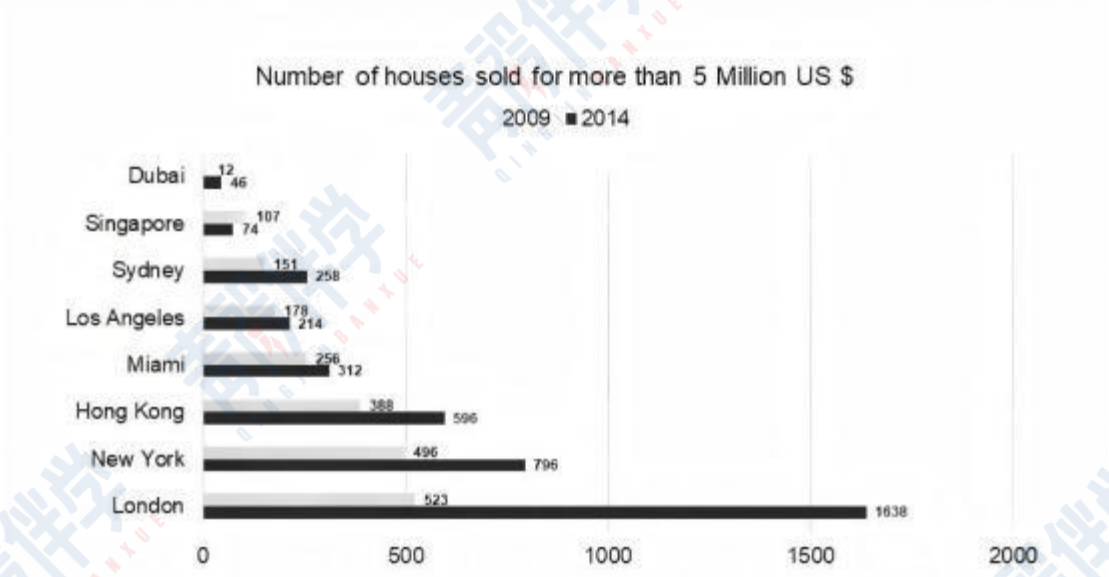

Regarding furniture and facilities, the double room contains two beds and two study desks placed in the northeast and southeast corners, alongside two windows on the east wall, a central dining set, a large cupboard, and two bookshelves. In contrast, the single room accommodates only one bed, one study desk, and a single window in the northeast, omitting the dining set, cupboard, and one bookshelf. Finally, while the kitchen appliances are positioned along the west wall in the double room, they are located along the southwestern wall in the single room.

6. 各国房屋出售情况

The chart below shows the number of houses sold in 8 cities in the world for more than 5 Million US dollars in 2009 and 2014.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant.

Write at least 150 words.

The bar chart compares the number of houses sold for more than 5 million US dollars in eight major cities in 2009 and 2014.

Overall, sales of high-value properties increased in most cities over the period. London and New York recorded the highest figures in both years, while Dubai and Singapore consistently had the lowest numbers.

In 2009, London led the market with approximately 523 houses sold, followed by New York at 476 and Hong Kong at 388. By contrast, Sydney recorded a much lower figure of 151, while Dubai had by far the smallest number, at just 12 sales.

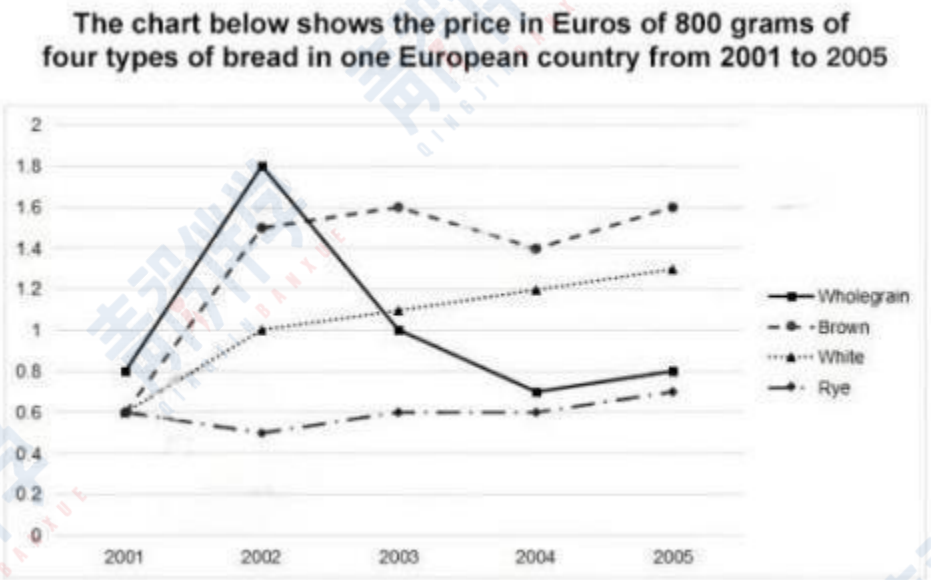

By 2014, sales rose sharply in several major cities. London saw a dramatic increase to around 1,638 houses, remaining the clear leader. New York and Hong Kong also experienced significant growth, reaching 796 and 596 respectively. In contrast, sales in Singapore fell to 74, although Dubai increased slightly to 46, still the lowest figure overall.

7. 面包价格

The chart below shows the price in Euros of 800 grams of four types of bread in one European country from 2001 to 2005.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant.

Write at least 150 words.

The line graph compares the price of 800 grams of four types of bread in a European country between 2001 and 2005.

Overall, brown and white bread became more expensive over the period, while rye remained the cheapest with only slight fluctuations. By contrast, wholegrain bread experienced the most dramatic change, rising sharply to a peak before falling back to its initial price.

Regarding wholegrain bread, its price rose from 0.8 euros in 2001 to a peak of 1.8 euros in 2002, after which it declined markedly and returned to 0.8 euros in 2005.

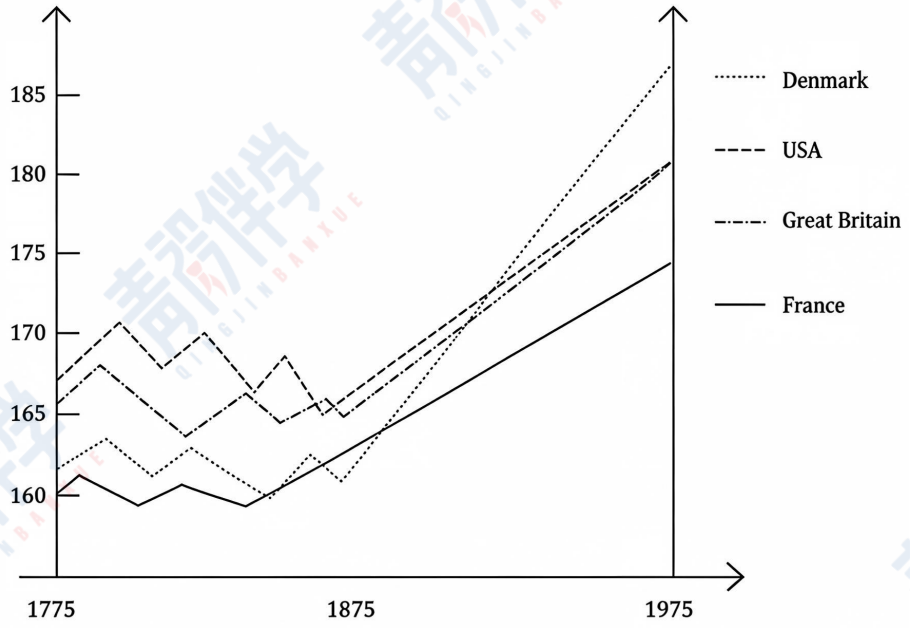

As for the other three varieties, brown bread increased significantly from 0.6 euros to 1.6 euros, ending as the most expensive type. White bread also showed a steady upward trend, climbing from 0.6 to 1.3 euros. By contrast, rye changed very little overall, dipping slightly from 0.6 to 0.5 euros in 2002 before finishing at 0.7 euros in the final year.

8. 男性的平均身高

The line graph illustrates the average height of men in four countries (Denmark, the USA, Great Britain and France) over the period from 1775 to 1975.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant.

Write at least 150 words.

The line graph compares the average height of adult males in Denmark, the USA, Great Britain, and France from 1775 to 1975.

Overall, male heights in all four nations fluctuated during the first century before undergoing a dramatic, sustained increase after 1875.

In 1775, the USA led at around 167 cm, closely followed by Great Britain at 166 cm. Despite peaking at roughly 171 cm mid-century, American height fell to 165 cm by 1875, matching British men. Meanwhile, Denmark's figure hovered between 160 cm and 163 cm before settling at 161 cm in 1875. French men remained the shortest, fluctuating around 160 cm throughout this period.

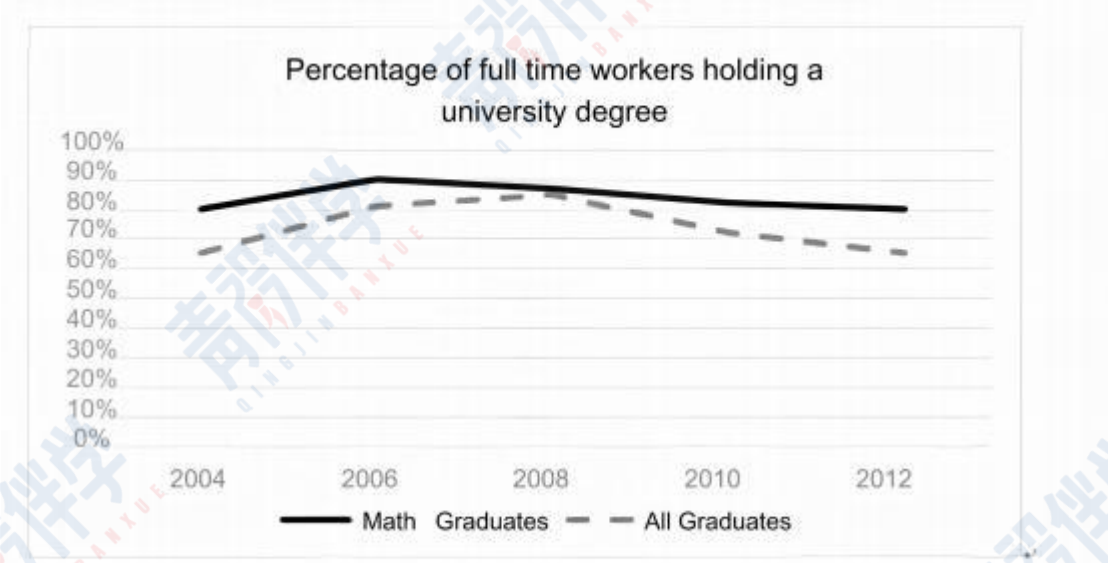

From 1875 onwards, all countries experienced a distinct upward trend. Denmark saw the most extraordinary rise, surging from 161 cm to approximately 186 cm in 1975 to surpass all other nations. Concurrently, the figures for both the USA and Great Britain climbed steadily to reach around 181 cm. Although French men also grew taller, reaching roughly 174 cm by 1975, France remained the lowest throughout the final century.

9. 毕业生的就业率和薪资

The graphs below show the percentage of math graduates and all graduates who got full-time jobs after graduating from a university in Australia, and also show the average salary of both grads, from 2004 to 2012.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant.

Write at least 150 words.

Math Grads	2004	2006	2008	2010	2012
	$41000	$43000	$50000	$51000	$60000
All Graduates	$41000	$43000	$45000	$45000	$51000

The line graph and table provide data on the percentage of Math graduates and all graduates securing full-time employment in Australia from 2004 to 2012, as well as their average salaries during the same period.

Overall, Math graduates consistently had a higher employment rate than all graduates, though both groups experienced a slight decline after 2006. In terms of salary, Math graduates saw a more substantial increase compared to all graduates by 2012.

In 2004, around 80% of Math graduates found full-time jobs, rising to a peak of over 90% in 2006 before declining to about 80% by 2012. For all graduates, the percentage increased from 65% in 2004 to 80% in 2006 but dropped back to 65% by 2012.

Regarding salaries, both groups started with an average of $41,000 in 2004. By 2012, Math graduates saw a significant rise to $60,000. By contrast, all graduates had a more modest increase to $51,000.

10. 各行业工资对比

The table below gives information about annual salaries of five employment sectors in Australia in 2006.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant.

Write at least 150 words.

Employment Sectors	Maximum	Minimum	Average
Sales	AU$ 216,100	AU$ 27,000	AU$ 70,000
Engineering	AU$ 145,080	AU$ 38,500	AU$ 80,000
IT and Telecommunication	AU$ 100,080	AU$ 38,000	AU$ 79,000
Education	AU$ 69,000	AU$ 33,000	AU$ 50,000
Travelling	AU$ 67,000	AU$ 32,000	AU$ 45,000

The table shows the annual salaries in five employment sectors in Australia in 2006, including the maximum, minimum and average figures.

Overall, the sales sector had the largest gap between the highest and lowest salaries, while engineering and IT had the highest average pay.

Looking at the higher-paying sectors, sales had a very large difference in salaries. The maximum salary was AU$216, 100, which was much higher than in other sectors, while the minimum was only AU$27,000. In comparison, engineering and IT had more stable salaries. The average salary in engineering was AU$80,000, which was slightly higher than IT at AU$79,000. Their minimum salaries were also similar, at AU$38,500 for engineering and AU$38,000 for IT.

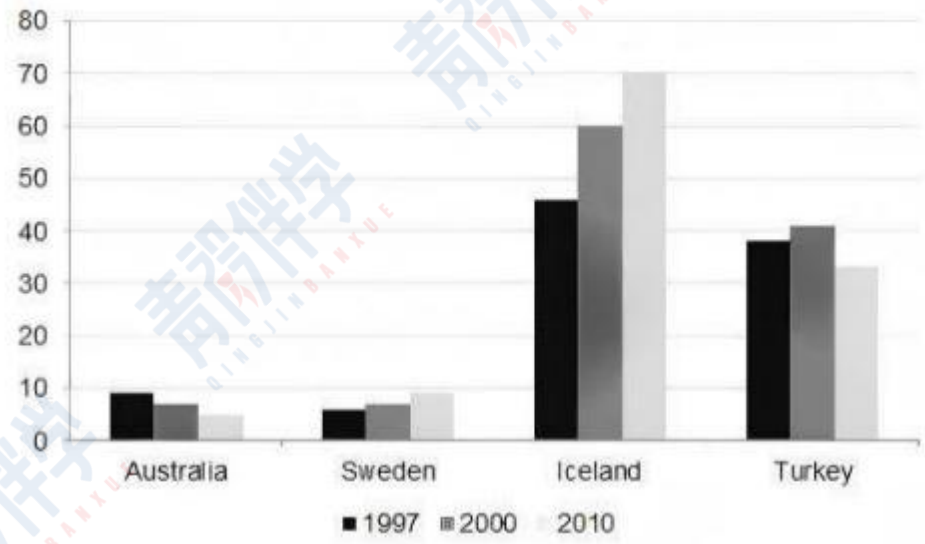

By contrast, education and travelling had lower salaries overall. The average salary in education was AU$50,000, while travelling had the lowest average at AU$45,000. The highest salaries in these two sectors were AU$69,000 and AU$67,000 respectively. In addition, their minimum salaries were AU$33,000 for education and AU$32,000 for travelling.

11. 可再生能源

The chart shows the proportion of renewable energy in total energy supply in 4 countries from 1997 to 2010.

Summarize the information by selecting and reporting the main features, and make comparisons where relevant.

Write at least 150 words.

The bar chart illustrates the proportion of renewable energy in the total energy supply of four countries—Australia, Sweden, Iceland, and Turkey—between 1997 and 2010.

Iceland stands out as having the highest proportion of renewable energy. In 1997, it was around 45%, which increased to approximately 60% in 2000 and further to about 70% in 2010, showing a consistent upward trend. In comparison, Turkey had a relatively more fluctuating pattern. In 1997, the proportion was about 38%, rose slightly to around 40% in 2000, and then dropped to 33% in 2010.

Both Australia and Sweden had much lower proportions of renewable energy throughout the period. In Australia, the figures were around 10% in 1997, 8% in 2000, and a little over 5% in 2010, indicating a declining trend. Sweden started at about 5% in 1997, increased slightly to around 7% in 2000, and then reached approximately 10% in 2010, showing a slow growth.

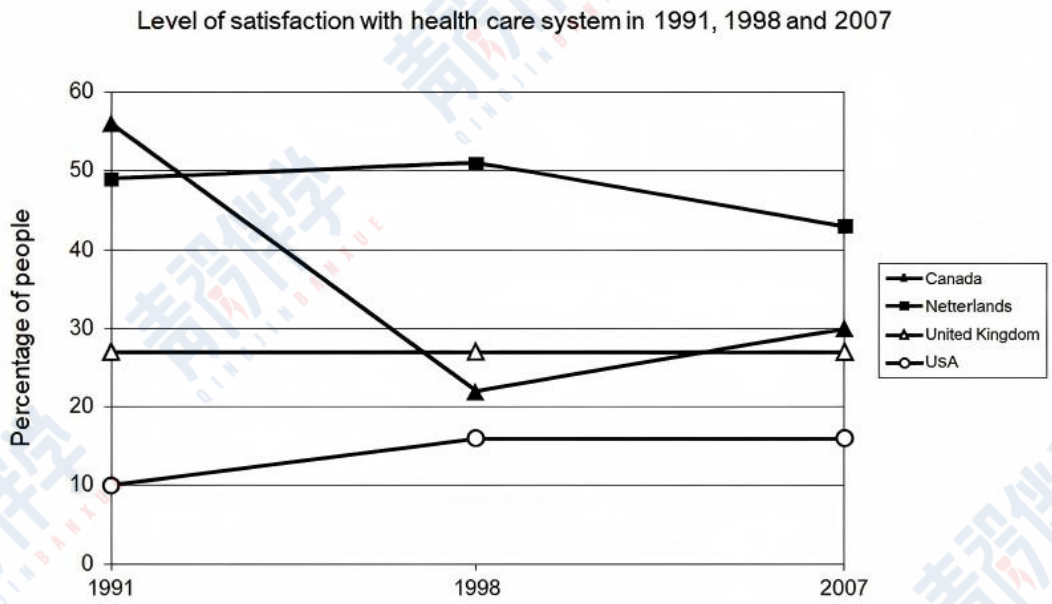

Overall, Iceland had the most significant share ofrenewable energy, while Australia and Sweden had relatively minor contributions, and Turkey was in between with some fluctuations.

12. 医疗满意度

The graph below shows people's level of satisfaction with the health care system in 4 countries between 1991 and 2007.

Summarise the information by selecting and reporting the main features and make comparisons where relevant.

Write at least 150 words.

The line graph illustrates the level of satisfaction with healthcare systems in four different countries from 1991 to 2007.

Overall, for most of the time frame, the Netherlands recorded the highest level of satisfaction, whereas the USA consistently remained at the lowest level.

Focusing on the two countries with the highest satisfaction levels, Canada ranked first in 1991, with 56% of respondents expressing satisfaction, compared with just under 50% in the Netherlands. The Dutch figure stayed relatively stable at around 50% until 1998, before declining slightly by the end of the period. In contrast, Canada saw a sharp drop to 20% in 1998. However, this was followed by a recovery, with satisfaction levels rising to 30% by 2007.

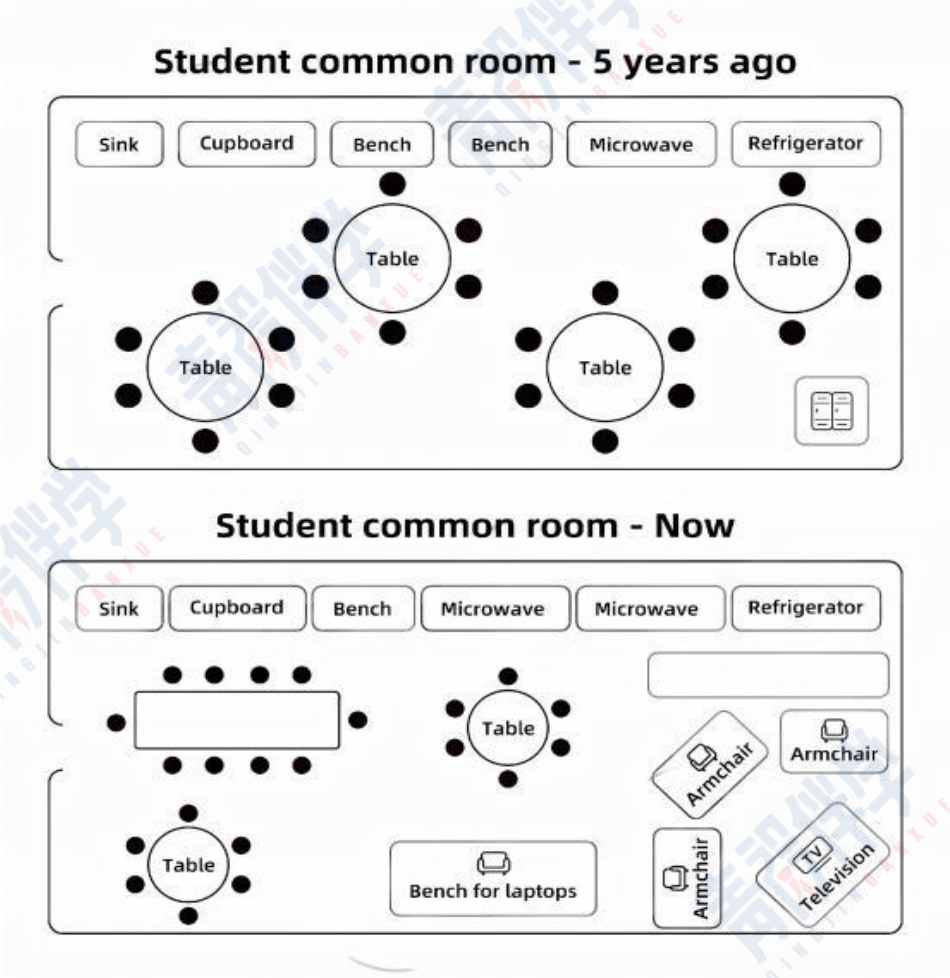

By comparison, satisfaction with the healthcare system in the USA was much lower. In 1991, only 10% of people reported being satisfied, and although this figure increased gradually, it reached only around 17% in 2007. Similarly, the satisfaction rate in the UK began at approximately 27% and showed very little variation throughout the period.

13. 公共休息室的变化

The diagram shows changes in a common student room.

Summarize the information by selecting and reporting the main features, and make comparisons where relevant.

Write at least 150 words.

The picture illustrates how a common room for students has changed over a period of five years.

Overall, the room has been modernised with the addition of more communal amenities, making it suitable for a wider range of student activities.

Five years ago, the design of the room was relatively simple. Along the left wall from the entrance were a sink, a cupboard, two benches, a microwave, and a refrigerator, arranged in that order. In the centre of the room, four sets of round tables and chairs were arranged in a zigzag pattern. In the far right corner, there was a bookshelf.

At present, the room has undergone significant changes. Most of the kitchen equipment along the left wall remains the same, except that one of the benches has been replaced by an additional microwave. In the central area, two of the round table sets have been removed to make room for a new rectangular table placed near the entrance, as well as a rectangular bench designated for laptop use positioned in the centre-right of the room. Finally, the original bookshelf has been replaced by a television, which is now surrounded by three new armchairs, creating a more comfortable and social space.

14. 四国牛奶产量

The table below shows the production of milk annually in four countries in 1990, 2000 and 2010.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant.

Write at least 150 words.

	Amount in litres		
Nations	1990	2000	2010
Netherlands	11,262,000	11,155,000	11,466,000
Australia	11,246,000	11,105,000	9,165,000
Tanzania	87,000	142,000	155,000
Guatemala	26,000	55,000	84,000

The provided table delineates the milk production volumes in liters for the Netherlands, Australia, Tanzania, and Guatemala over the years 1990, 2000, and 2010.

Initially, in 1990, the Netherlands and Australia were close in their production levels, each with just over 11 million liters. By the end of the 20-year period, the Netherlands had a marginal production increase to about 11.47 million liters. Conversely, Australia's figures declined with each passing decade, culminating in 9.17 million liters in 2010.

In stark contrast, Tanzania and Guatemala, which had much lower starting points, showed robust growth. Tanzania's production increased from 87,000 liters to 155,000 liters, while Guatemala's rose from 26,000 liters to 84,000 liters by 2010, showcasing more than threefold growth.

To summarize, the two initially leading producers, the Netherlands and Australia, had differing trends, with the former maintaining and slightly building upon its production and the latter experiencing a decline. Meanwhile, Tanzania and Guatemala, though starting from a lower base, demonstrated substantial increases in their milk production capacities by the year 2010.

15. QS200学校科目情况

The table shows the number of universities ranked top 200 in the world (2011) in three subjects in five countries.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant.

Write at least 150 words.

Number of universities ranked top 200 in the world (2011)

Country	Subjects		
	Biology	Medicine	Psychology
The USA	69	54	58
The United Kingdom	30	24	29
Australia	9	13	17
New Zealand	6	2	4
Canada	9	12	14

The table compares the number of universities in five different countries that were ranked among the world's top 200 across three subjects—Biology, Medicine, and Psychology—in the year 2011.

Overall, the USA dominated all three academic fields by a wide margin, followed by the UK in second place. In contrast, New Zealand recorded the smallest number of top-ranked institutions.

In detail, the USA led all nations with 69 top-200 universities in Biology, 58 in Psychology, and 54 in Medicine. The UK consistently occupied the second position, boasting roughly half as many prestigious universities as the USA in each field, with 30 in Biology, 29 in Psychology, and 24 in Medicine.

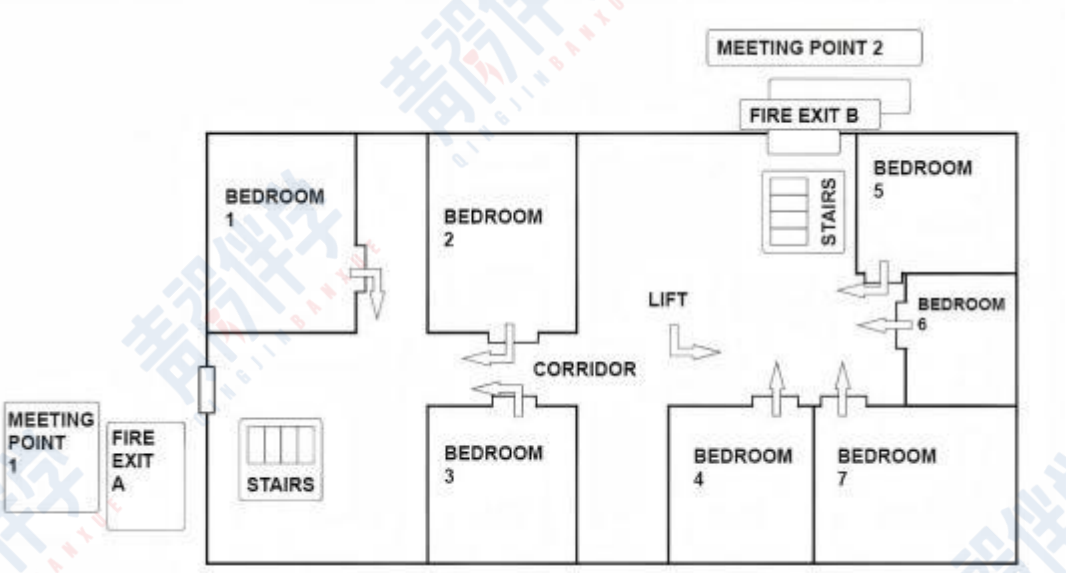

Regarding the remaining three countries, Australia and Canada displayed very similar patterns, with Psychology having the highest representation (17 for Australia and 14 for Canada), followed by Medicine (13 and 12, respectively) and Biology (9 for both). Finally, New Zealand had the fewest top-tier universities in every subject, peaking at 6 in Biology, followed by 4 in Psychology and just 2 in Medicine.

16. 火灾逃生出口

The diagram below shows the layout of a part of a building, indicating the position of the fire exits.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant.

Write at least 150 words.

The given illustration depicts the current layout of a building, showing the locations of two fire exits positioned along the corridor.

Overall, both fire exit doors are situated near designated meeting points—one is located outside the building, while the other is positioned indoors.

There are seven bedrooms in total, and a lift is located in the center of the building, providing access to all rooms on the floor. Notably, there are two staircases placed at the fire exit doors in the southwest and northeast corners, respectively, which serve as evacuation routes in case of fire. Specifically, occupants of bedrooms 1, 2, and 3 can exit their rooms, move through the corridor, and use Exit A near the main entrance to escape the building and gather at Meeting Point 1.

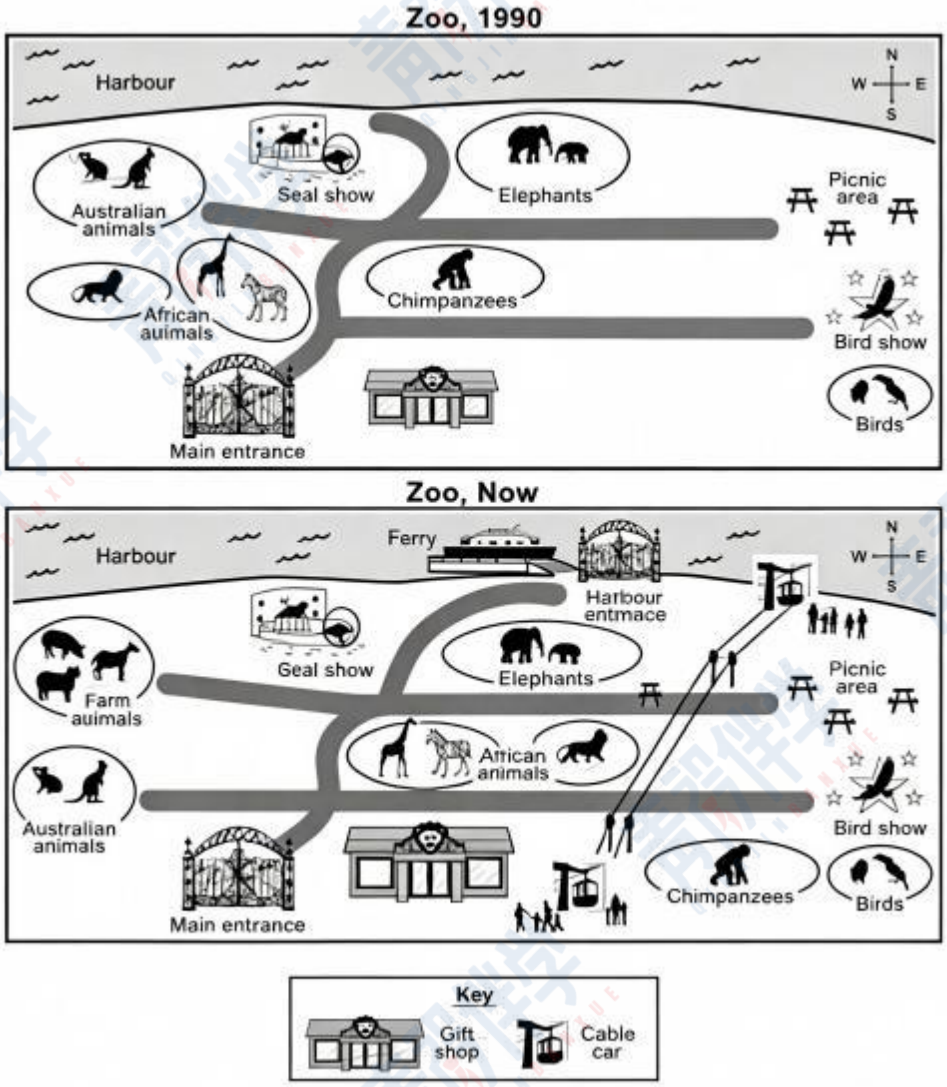

In contrast, in the event of a fire, those staying upstairs need to quickly descend the stairs next to bedroom 5 to reach the first floor and access Exit B. Additionally, residents of the remaining four rooms (numbers 4, 5, 6, and 7) also evacuate through Exit B and gather at Meeting Point 2.

17. 澳大利亚动物园

The maps show the changes that have taken place at an Australian Zoo between 1990 and now.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant.

Write at least 150 words.

The maps illustrate the changes that have taken place in an Australian zoo from 1990 to the present day.

Overall, the zoo has experienced significant redevelopment, with the addition of new facilities, the relocation of several animal areas, and improved transport connections. However, the picnic area has remained unchanged.

In 1990, the zoo mainly consisted of animal enclosures, with very limited modern facilities. In the northwest corner, there was an area for African animals. To the north of this section were the Australian animals and a seal show. In the centre of the zoo, there were a chimpanzee habitat and an elephant area. The entire eastern side of the zoo was used as a picnic area, which also included a bird enclosure and a bird show area.

At present, the zoo has been modernised considerably. The Australian animal enclosure on the western side has been moved slightly southwards, and a new farm animals area has been added nearby. The African animal section has been moved to the central part of the zoo. Meanwhile, the former chimpanzee area has been relocated to the southeast corner. A cable car has been constructed, running from the north to the south of the zoo, greatly improving accessibility for visitors. In addition, a ferry terminal has been built in the northern part of the zoo to enhance the visitor experience. Despite these developments, the picnic area in the east has not been altered.

18. 六国垃圾产量

The table below shows the amount of waste production (in millions of tonnes) in six different countries over a twenty-year period.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant.

Write at least 150 words.

	1980	1990	2000
Ireland	0.6	*	5
Japan	28	32	53
Korea	*	31	19
Poland	4	5	6.6
Portugal	2	3	5
US	131	151	192

The table compares the amount of waste produced in six different countries in 1980, 1990 and 2000.

Overall, the US produced by far the largest amount of waste in all three years, while most countries showed an upward trend. Korea was the only country to record a decline, whereas Japan saw a particularly sharp increase by 2000.

Looking first at the countries with relatively high levels of waste, the US recorded the highest figures throughout the period, rising from 131 million tonnes in 1980 to 151 million tonnes in 1990, before reaching 192 million tonnes in 2000. Japan also experienced significant growth, with its waste output increasing from 28 million tonnes to 53 million tonnes by the end of the period. Korea, for which there was no data in 1980, produced 31 million tonnes of waste in 1990, but this figure fell markedly to 19 million tonnes in 2000.

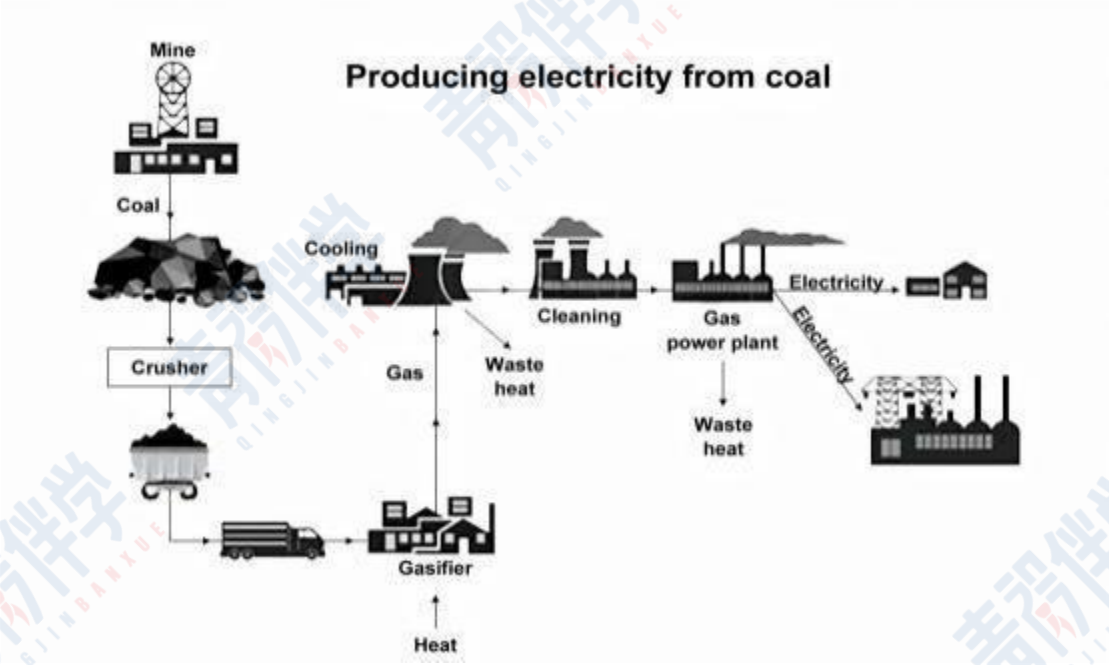

Turning to the countries with much lower waste production, Poland, Portugal and Ireland all remained well below the figures for the US and Japan. Poland showed a gradual increase from 4 million tonnes in 1980 to 6.6 million in 2000. Portugal followed a similar pattern, rising steadily from 2 million tonnes to 5 million. Ireland had the lowest figure overall at just 0.6 million tonnes in 1980, although its waste production rose substantially to 5 million tonnes by 2000.

19. 煤炭发电流程

The diagram below shows how one type of coal is used to produce electricity.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant.

Write at least 150 words.

The diagram illustrates the procedure of generating electricity from a specific type of coal, outlining the various stages involved in the transformation from raw material to usable energy.

Overall, the process comprises several sequential steps, beginning with the extraction of coal and culminating in the distribution of electricity, with intermediate stages facilitating conversion and processing.

Initially, the process commences with the extraction of coal from a mine. Subsequently, the mined coal undergoes crushing, wherein it is reduced to smaller fragments. This crushed coal is then transported to a gasifier, where it is heated and transformed into gas. The gasification stage is crucial, as it facilitates the conversion of solid coal into gaseous form, which is a prerequisite for the subsequent production of electricity. Following gasification, the gas is channeled through a cooling system as well as a cleaning procedure to prepare it for utilization in the power plant.

Once cooled and cleaned, the gas enters the gas power plant, which is responsible for generating electricity. The electric output produced is subsequently distributed to residential and industrial consumers. It is noteworthy that this power generation process is not without its byproducts; the system also produces heat waste, which results from the cooling phase as well as the power generation.

20. 动态表格-出行方式

The table below gives information about the average annual distance travelled by adults and the types of travel in 1977 and 2007.

Summarise the information by selecting and reporting the main features and make comparisons where relevant.

Write at least 150 words.

Average distance travelled per person in kilometres		
Type of transport	**1977**	**2007**
car	3,500	7,100
walking	400	300
motorcycle	100	90
bus	800	500
train	900	1,000
taxi	200	800
bicycle	100	80

The table compares the average annual distance traveled by adults across various modes of transportation in 1977 and 2007. The modes of transportation include walking, bicycle, car, motorcycle, bus, train, and taxi.

In 1977, the most common mode of travel was by car, with an average distance of 3,500 miles per year. This figure more than doubled by 2007, reaching 7,100 miles, highlighting a significant increase in reliance on cars. Walking, which was the fourth most common mode in 1977 with 400 miles, saw a decline to 300 miles in 2007.

Bus travel decreased from 800 miles in 1977 to 500 miles in 2007, while train travel saw a slight increase from 900 miles to 1,000 miles over the same period.

Additionally, taxi travel experienced a notable increase from 200 miles in 1977 to 800 miles in 2007, indicating growing use of this mode.

Bicycle and motorcycle travel experienced slight declines, with bicycles dropping from 100 miles in 1977 to 80 miles in 2007, and motorcycles from 100 miles to 90 miles. Overall, the data reflects a shift towards increased car usage and decreased reliance on walking and bus travel.
