1.少学习多锻炼

Parents should encourage children to spend less time studying and more time doing physical activities.

To what extent do you agree or disagree?

In recent years, the rising academic burden on children has sparked widespread concern among parents and educators. While physical exercise is undeniably vital for childhood development, I disagree with the idea that study time should be reduced across the board. Instead, parents should focus on managing study efficiency so that children can engage in regular physical activity without compromising their academic foundation.

On the one hand, encouraging children to participate in physical activities brings distinct health and psychological benefits that pure academic work cannot provide. When children engage in regular sports, their bodies release endorphins and experience increased blood circulation, which helps relieve the mental strain accumulated from long hours of stationary learning. Furthermore, team sports like basketball or football create dynamic social settings where children must cooperate, handle victory and defeat, and resolve conflict with peers. These real-world interactions foster social competence and emotional resilience—qualities that traditional textbook study rarely cultivates.

On the other hand, simply cutting back on study time is a misplaced solution that could harm a child's future opportunities. In most modern societies, academic performance remains the primary metric for high school and university admissions, which directly shapes a young person's career path. If parents blindly reduce study hours without addressing unproductive habits, children may simply fall behind in core subjects without gaining any meaningful athletic benefit. A far more effective approach is to eliminate inefficient study practices, such as passive memorization or digital distractions during homework. By mastering better time management, children can complete their academic tasks in less time, naturally freeing up room for sports.

In conclusion, I disagree that parents should deliberately cut down on study time just to accommodate more physical activity. Academic knowledge and physical fitness are not mutually exclusive; rather than treating them as a zero-sum trade-off, parents should guide children to study more efficiently, ensuring they have ample time for exercise while maintaining strong academic performance.

2.高层管理者与普通员工薪资差距

Some people think it is a good thing for senior management positions to have very high salaries compared to other workers of the same company or organisation.

To what extent do you agree?

The debate over whether senior management should receive significantly higher salaries than other employees is ongoing. While some argue that these high salaries are justified by the responsibilities and impact of these roles, others believe that excessive pay gaps can harm an organization. I believe that while senior management deserves higher compensation, excessively large pay differences can be detrimental and can even undermine the long-term success of the organization.

Senior management roles carry substantial responsibilities that directly affect a company's success. These positions often require extensive experience and advanced skills, justifying higher salaries to attract and retain top talent. For example, the decisions made by a CEO can determine the growth or decline of a multinational corporation, making higher pay reasonable and necessary to secure the best leadership.

However, large pay gaps between senior management and other employees can create feelings of inequality and resentment. This can lower morale and productivity, as employees who feel undervalued may be less motivated to perform well. When the workforce sees that only top executives benefit significantly, they may be less inclined to contribute their best efforts, leading to a disengaged and less productive work environment.

Furthermore, allocating too much to senior management salaries can reduce resources available for employee development and benefits. Organizations that prioritize equitable compensation are likely to foster a more loyal and motivated workforce, leading to a more collaborative and committed environment. A focus on fair distribution of resources ensures that all employees feel valued, which can enhance overall organizational performance.

In conclusion, while senior management deserves higher salaries due to their roles, excessive pay gaps should be avoided. A reasonable compensation structure can lead to a more motivated and productive workforce, ultimately benefiting the organization as a whole and ensuring long-term success.

3.领导的重要品质

Intelligence is the most important factor for a leader.

To what extent do you agree or disagree?

Give reasons for your answer and include any relevant examples from your knowledge and experience.

Write at least 250 words.

Leadership skills consist of various traits, yet it is often suggested that the primary one for a leader is intelligence. I completely agree with this view for several reasons.

The main argument supporting this view is that it is vital for someone in a leadership position to be able to guide a team along the right path. This requires a person to be quick-witted and intelligent, as they must analyze and process a large amount of information. Moreover, leaders not only need to think carefully about strategies, but they must also come to a clear conclusion, as there are often multiple options to consider. Additionally, since leaders generally cannot afford to make mistakes, they must scrutinize every detail and potential outcome to ensure success. As a result, their effectiveness is largely dependent on their intelligence.

Another reason why intelligence is crucial is that it helps leaders address weaknesses effectively. Undoubtedly, it is essential for a leader to help their team members identify their weak points and find solutions to improve them, as minimizing weaknesses plays a key role in making progress. This is especially useful when dealing with a unique problem that requires a different and analytical approach. There are also benefits for the leaders themselves, as they are not immune to flaws. They need to address their own weaknesses with even more precision. However, intelligent leaders are typically aware of their own shortcomings and can take appropriate actions to overcome them, which ultimately benefits both the leader and their team.

In conclusion, I believe that intelligence is a critical factor for a leader, as it provides two essential benefits for the success of the team: the ability to guide the team effectively and the capacity to address weaknesses efficiently.

4.公司提供运动和社交设施

All large companies should provide sports and social facilities for the local community.

To what extent do you agree or disagree with this statement?

In recent years, there has been growing debate about whether large companies should be responsible for providing sports and social facilities for the local community.
While I agree that corporations can play a positive role in supporting society, I do not believe it should be considered an obligation for all big businesses.

On the one hand, there are strong arguments for encouraging companies to contribute in this way. First, sports and social facilities improve the well-being of local residents by promoting healthier lifestyles and greater social interaction. For example, a gym or community centre built by a company could reduce health problems such as obesity
and also create spaces where people build stronger connections. Second, companies benefit indirectly from such investments. By supporting the community, they can
enhance their reputation, build customer loyalty, and even improve employee satisfaction, as workers often prefer companies with a strong sense of social responsibility.

On the other hand, making it compulsory for all large companies may create unfair burdens. Businesses primarily exist to generate profit, provide jobs, and pay taxes. Forcing them to build facilities could distract them from their core operations or
reduce their competitiveness, particularly in industries with high operating costs. Moreover, providing community facilities should remain the responsibility of
governments, which collect taxes and are better placed to allocate resources fairly among different regions and social groups.

In conclusion, while I believe it is highly beneficial for companies to support local
communities by building sports and social facilities, it should not be seen as a duty for all large businesses. Instead, governments should take the main responsibility, while companies should be encouraged, but not forced, to contribute.

5.交通拥堵税

In some cities, governments have tried to reduce traffic congestion. For instance, they have imposed a congestion tax during rush hour.

Do you think this development is positive or negative?

In many cities, governments have introduced congestion charges during peak hours in an effort to reduce traffic congestion. I strongly believe that this policy represents a positive development, as it helps alleviate environmental problems and encourages more sustainable transport choices.

One key benefit of congestion charges is their ability to reduce the number of private vehicles on the road. By increasing the cost of driving during rush hours, unnecessary car journeys are discouraged, which leads to lower traffic volumes. As a result, levels of air pollution and noise pollution are significantly reduced, improving overall environmental quality in densely populated urban areas. This is particularly important in major cities, where excessive car use is a primary cause of traffic congestion.

Another important advantage is the positive impact on commuters' well-being. Severe traffic congestion often results in long travel times, causing stress, frustration and mental fatigue. By easing traffic flow, congestion charges can make daily journeys more predictable and less exhausting. In addition, revenue generated from these charges can be invested in improving public transport systems, such as expanding bus and metro services. This further encourages people to shift away from private cars, creating a more efficient and balanced transport network.

In conclusion, I firmly believe that imposing congestion charges during peak hours is a positive step forward. Not only does this policy reduce pollution and traffic-related stress, but it also supports the development of better public transport. In the long run, congestion pricing can help cities become cleaner, quieter and more livable places.

6.远程工作对雇主无益

Many employees can now do their work from home using modern technology. However, this change may only benefit workers, not the employers.

To what extent do you agree or disagree?

Many employees are now able to work from home with the help of modern technology. However, some people argue that this development benefits only workers rather than employers. I largely agree with this view, as the advantages for employees are more direct and substantial, while the benefits for employers are relatively limited and conditional.

One major reason why remote work mainly benefits employees is the flexibility it provides. Working from home allows individuals to arrange their working hours more freely and better balance professional responsibilities with personal needs. This flexibility leads to higher job satisfaction and reduced stress, which are immediate and personal advantages for workers. For example, employees can adjust their schedules to meet family responsibilities without compromising their work performance, something that is far less achievable in a traditional office setting.

Another significant benefit for employees is the improvement in work-life balance. By eliminating long commutes, workers can spend more time with their families and maintain better mental well-being. This not only improves overall quality of life but also helps prevent long-term issues such as burnout and chronic stress. From the employers' perspective, remote work may reduce certain operational costs, such as office space and utilities. However, these savings are often inconsistent and may be offset by investments in digital infrastructure and remote management systems.

Despite some potential advantages for employers, managing a remote workforce remains demanding. Monitoring employee performance, ensuring collaboration and maintaining productivity can be problematic, particularly in large organisations. Unlike employees, who experience daily and tangible benefits, employers must rely heavily on effective supervision and technology to achieve comparable outcomes. As a result, while employers may gain indirect or short-term benefits, employees enjoy clearer and more consistent advantages from working remotely.

In conclusion, although working from home can offer certain benefits to employers, these are generally limited and highly dependent on management quality and technology. In contrast, employees benefit more directly and reliably, especially in terms of flexibility and work-life balance.

7.极限运动

Extreme sports such as skydiving and skiing are very dangerous and should be banned.

To what extent do you agree or disagree with this view?

Nowadays, extreme sports are increasing in popularity around the world, with extreme sports competitions offering thrill and adventure to all participants involved. Though some people are in favor of outlawing these dangerous sports, I think that everyone should have the freedom to participate in extreme sports.

On one hand, it is true that extreme sports such as water rafting, car racing, kickboxing, and sky diving are inherently risky. People who are inexperienced might be reckless and unprepared, which would increase the likelihood of a life-threatening injury. Even a skilled and highly experienced sports person could make a minor mistake and end up getting severely injured or losing their lives. For example, the famous snowboarder Caleb Moore attempted a backflip on his snowmobile during a competition, but he ended up in a violent crash, eventually passing away from complications resulting from his injury. Accidents like these are not only devastating to the competitors, but also to their friends, families, and dedicated fans.

Nevertheless, even though extreme sports are risky, people should still have the freedom to participate in them as they wish. Extreme sports competitors generally relish the challenge, thrill, and adrenaline rush inherent in these sports activities, and many are well-aware and accepting of the risks involved. What's more, extreme sports often bring glorious fame and prestige to the competitors and even recognition to their country. Since extreme sports are significantly more challenging and require more advanced technique than other sports, competitors often feel a sense of pride in their accomplishments. Rather than outright banning extreme sports, governments should ensure that the sports facilities meet the required legal standards of safety and that all competitors take the necessary precautions.

In conclusion, I believe that—despite the risks—people should have the freedom to participate in extreme sports because it provides immense excitement and adventure to many.

8.家用电器

In many countries people can buy a wide range of household goods (for example, TV, microwave ovens and rice cookers).

Is it a positive or negative development?

In modern society, an increasing number of people purchase various household appliances such as televisions, microwaves and rice cookers. In my view, this trend brings more advantages than disadvantages, though some negative consequences cannot be ignored.

To begin with, these goods have greatly enhanced convenience and comfort in people's daily routines. For instance, microwaves and rice cookers shorten the time spent on preparing meals, which is particularly beneficial for working professionals who often struggle to balance career and family responsibilities. Similarly, washing machines and vacuum cleaners reduce physical labour, allowing individuals to allocate their time to more meaningful or productive activities. As a result, the overall quality of life has improved remarkably.

Moreover, household devices such as televisions and smart speakers provide people with easy access to information, knowledge and entertainment. This not only broadens horizons but also helps people stay connected with global events. In a fast-paced world, being well-informed is crucial, and technology makes this process far more efficient than in the past.

Nevertheless, the rapid consumption of these products also generates challenges. The production and disposal of electronic appliances lead to environmental degradation, especially in the form of e-waste. Additionally, overdependence on machines may discourage physical activity, contributing to sedentary lifestyles and health concerns such as obesity.

In conclusion, although there are undeniable drawbacks, I believe the positive aspects of using household goods outweigh the negatives. With stronger recycling systems and greater awareness of healthy living, the benefits of these devices can be maximised while minimising their harmful effects.

9.文物的归还

Historical objects in museums all over the world should be returned to their coun try of origin.

To what extent do you agree or disagree?

In recent years, whether old historical objects in foreign museums should be sent back to their home countries has become a big debate. In my opinion, I partially agree with this idea. Returning these items respects history and builds local pride, but keeping some of them in big international museums protects them from damage and helps more people learn about different cultures.

On the one hand, returning historical objects brings clear benefits to their home countries. Firstly, returning old objects helps fix past mistakes and makes countries friendlier. Many treasures were taken away during past wars. When foreign countries return them, it shows respect for the local history, which helps heal past hurts and brings different nations together. Secondly, showing local treasures at home makes local people proud of their culture. These objects are important symbols of a country's history. When local people can see them in person, they can easily learn about their past, which makes them feel more connected to their home and culture.

On the other hand, there are good reasons why not all objects should be sent back immediately. For one thing, moving old and weak objects over long distances can easily break them. Many ancient items are very old and can be ruined by long trips or changes in weather and temperature. Therefore, keeping them in modern, safe museums is a better choice. Furthermore, big international museums make it easy for people to learn about different cultures in one place. Famous places like the British Museum welcome millions of visitors each year. Showing objects from all over the world in one museum allows tourists to learn about different cultures at the same time, spreading knowledge around the globe.

In conclusion, I partially agree that historical items should be sent back to where they came from. Returning them rights past wrongs and makes local people proud. However, to keep these objects safe and help more people learn, countries should talk and work together rather than returning everything right away.

10.公司工厂迁移

Traffic and housing problems could be solved by moving large companies, factories and their employees to the countryside.

To what extent do you agree or disagree?

In today's world, it is widely believed that relocating large companies, factories, and their employees to rural areas could effectively solve urban problems such as traffic congestion and housing shortages. I completely agree with this view because such a move would significantly reduce both traffic pressure and the demand for accommodation in cities.

The first and foremost benefit of moving big enterprises and factories to the countryside is the reduction of traffic congestion in urban centers. When businesses and their employees relocate to rural regions, the number of daily commuters traveling to and from cities will decline sharply. Consequently, there will be fewer vehicles on the roads, leading to smoother traffic flow and less pollution. For example, a recent study in the United States and the United Kingdom revealed that government incentives encouraging major corporations to establish offices and factories outside urban areas resulted in a noticeable decline in congestion levels in cities such as New York and London between 2000 and 2020. This demonstrates that decentralizing industries can be an effective strategy to mitigate urban traffic problems.

In addition, this policy could help alleviate housing shortages in metropolitan areas. Big companies often create attractive employment opportunities, drawing large numbers of workers to live near their workplaces. This influx of people drives up housing demand and property prices, making it difficult for residents to find affordable accommodation. However, by relocating these enterprises to the countryside, cities would experience reduced population density, easing the housing crisis. At the same time, this would promote development in rural areas by making better use of underutilized land and infrastructure.

In conclusion, I firmly believe that transferring major companies, factories, and their employees to rural areas can effectively address two pressing urban challenges—traffic congestion and housing shortages. This approach not only improves living conditions in cities but also contributes to balanced regional development.

11.追寻理想社会

Throughout the history, people dream to live in a perfect society while they haven't agreed on what the ideal society would be like.

What do you think is the most important element that makes a perfect society?

How do people achieve an ideal society?

Since the last few centuries, creating a perfect community has been a desire of many intellectuals, although they haven't identified the character of an ideal society. This essay will discuss the crucial elements to build an ideal society as well as the ways to get it in the following paragraphs.

To begin with, the vital element to building an ideal community, the most important element is education. This element brings many benefits not only to an individual but also to the whole of mankind. For instance, educated members of society can think independently and they can remove social vices. Education can eradicate the practices of discrimination in society, and as a result, harmony and peace will build up in society, which is the most essential part of any perfect society. Moreover, health plays a vital role in the creation of a society. The healthy members of society are more productive; their energy and resources can be fully utilized for the development of society, instead of curing and defending the health-related problems of the members.

On the other hand, to achieve a perfect community these elements should be used by people effectively and efficiently. Educated people should provide their services to all segments of society. For example, the medical field, science, literature, and, many other fields need dedicated scholars to develop them. The culture and traditions should be wisely preserved by the people. Furthermore, healthy people in society can work effectively. Hence, to achieve an ideal society the citizens have to work together without any discrimination in any section of the industry.

In conclusion, the intellectuals should utilize the most important elements of the society such as education and health. The integrated efforts of people could achieve a dream of a perfect society.

12.科技发展对犯罪的影响

Some people think technology development decreases crime, while others believe it actually encourages crime.

Discuss both views and give your own opinion.

The impact of technology on crime rates is a complex issue with strong arguments on both sides. Proponents believe technological advancements are a boon to public safety, while others argue they create new avenues for criminal activity. Examining these viewpoints will help us understand the true relationship between technology and crime.

Advocates for technology's crime-fighting potential point to advancements in surveillance and law enforcement tools. Security cameras, for instance, deter crime by increasing the perceived risk of getting caught. Additionally, data analysis software helps police identify crime patterns and predict future incidents, allowing for targeted patrols and proactive measures. Furthermore, digital forensics allow for more effective investigation and prosecution of crimes.

However, critics argue that technology can also be a breeding ground for criminal activity. The rise of the internet has facilitated cyber crime, with criminals exploiting vulnerabilities to steal data, commit fraud, or launch cyber attacks. The anonymity provided by online platforms can embolden criminals, while readily available tutorials and forums can even create a sense of community for them. Additionally, concerns exist regarding the potential misuse of surveillance technology for mass monitoring, infringing on individual privacy.

In my opinion, technology is a double-edged sword when it comes to crime. While it undoubtedly offers valuable tools for law enforcement, it also presents new challenges. The key lies in striking a balance. We must utilize technology's benefits while remaining vigilant against its potential misuse. Investing in cyber security measures, fostering responsible online behavior, and ensuring ethical implementation of surveillance are crucial steps in this ongoing battle. By harnessing technology's power for good and addressing its pitfalls, we can create a safer future for all.

13.交流技术影响社会关系

Many people think modern communication technology is having some negative effects on social relationships.

Do you agree or disagree?

Give reasons for your answer and include any relevant examples from your knowledge and experience.

Write at least 250 words.

Many people believe that modern communication technology has a negative impact on social relationships. I agree with this view to a large extent, as excessive reliance on digital communication can weaken face-to-face interaction and reduce the quality of personal relationships.

One major reason why modern communication technology harms social relationships is that it reduces direct, in-person communication. Although messaging apps and social media make it easier to stay in contact, they often replace meaningful face-to-face conversations. When people communicate mainly through screens, they may miss important social cues such as tone of voice and body language. As a result, misunderstandings can occur more easily, and emotional connections may become weaker. For example, family members may spend time chatting online instead of talking to each other at home, which can gradually reduce closeness.

Another negative effect is that constant online communication can lead to superficial relationships. Social media platforms encourage users to interact briefly and frequently, rather than engage in deep and meaningful conversations. This can create a sense of connection without real emotional support. Over time, people may have many online contacts but few close relationships they can rely on. In addition, excessive use of communication technology can cause individuals to become distracted during social interactions, making others feel ignored or unimportant.

In conclusion, while modern communication technology offers convenience, I believe it has significant negative effects on social relationships. By reducing face-to-face communication and encouraging shallow interactions, it can weaken emotional bonds between people. Therefore, it is important to use communication technology in moderation and maintain meaningful personal connections in real life.

14.理科的选择

Nowadays, not enough students choose science subjects in universities in many countries.

Why is this?

What are the effects on society?

In today's knowledge-based society, science and technology are advancing at an unprecedented rate. Despite this rapid progress, the numbers of university students who choose science subjects show a declining trend in many countries. This essay will analyze its underlying reasons and negative effects on society.

The first reason for this trend may involve the recognition that science subjects are more challenging than other subjects. Obtaining degrees in science requires more effort. For instance, to graduate from the school of physics or chemistry, students have to learn a wide range of theoretical courses and spend many years working in laboratories. This process is lengthy and tedious, which may dissuade many young people from pursuing science as a major.

Moreover, a lack of interest in science contributes to the low enrollment in science subjects. In a society where fame and fortune determine a person's value, younger generations tend to idolize popular stars and influencers rather than scientists. Additionally, primary and secondary school curricula often fail to adequately emphasize the importance and appeal of science. With limited knowledge and little interest in science, fewer people choose science subjects when they enter university.

The declining number of students in science subjects at universities has profound effects on society. There will be a shortage of personnel capable of conducting scientific study and research, as universities reduce the supply of qualified graduates majoring in science. Declining scientific research could lead to hindered innovation and technological stagnation, negatively affecting economic growth and social progress. Countries with fewer skilled scientists may struggle to keep up with advancements made by others, thus losing competitiveness in the international arena.

In conclusion, the declining enrollment in science subjects is attributed to multiple factors, and this issue can have serious consequences for society. Efforts should be made at all levels of education to foster interest in science and to emphasize its importance in driving progress and innovation. Only by addressing these challenges can we ensure a brighter future for science and society as a whole.

15.生育年龄推迟

Some people choose to have their first child at an older age.

What are the reasons?

Do the advantages outweigh the disadvantages?

In many countries today, an increasing number of people choose to have their first child at a later age. This trend is influenced by several social and economic factors. Although delaying parenthood has both advantages and disadvantages, I believe the benefits generally outweigh the drawbacks.

One major reason why people become parents later is the desire to establish a stable career before starting a family. In modern society, many young adults focus on higher education and professional development in their twenties. They hope to secure a well-paid job, gain financial independence, and create a comfortable living environment before welcoming a child. Another contributing factor is the high cost of raising children. Housing, childcare, and education expenses have risen sharply in recent years, making younger couples feel unprepared to take on the financial burden. In addition, many people now value personal growth and prefer to spend their early adulthood travelling, exploring hobbies, or building relationships, which naturally delays parenthood.

Despite some clear disadvantages, such as reduced fertility and increased health risks during pregnancy, having children later in life also offers significant benefits. Older parents are usually more emotionally mature and better prepared to take on the responsibilities of raising a child. They tend to have greater financial stability, which allows them to provide a safer home, better healthcare, and more educational opportunities for their children. Moreover, parents who have already achieved personal and professional goals may feel less pressure balancing work and family, allowing them to spend more quality time with their child. In contrast, very young parents often struggle with stress, limited income, and lack of life experience, which can affect both their well-being and their child's development.

In conclusion, people choose to have their first child later for financial, educational, and personal reasons. Although this trend can create some challenges, I believe that the advantages, particularly greater stability and maturity, outweigh the disadvantages for most families.

16.广告的影响

Some people say that advertising has positive economic effects.

Others think it has negative social effects because it will make people feel dissatisfied with who they are and what they have.

Discuss both views and give your own opinion.

Give reasons for your answer and include any relevant examples from your knowled ge and experience.

Write at least 250 words.

People have various views regarding whether advertising is a positive or negative thing. Although I recognise that there are economic benefits from advertising, I also think that advertising should be restricted to some extent because it can harm people's mental health.

For one thing, advertising contributes to economic growth by increasing consumer spending. It does so by providing consumers with information about products and services, many of which fulfil certain needs of consumers. For example, when I saw a commercial for a mobile phone, I realised that it would be the perfect replacement for my dying phone. Without this advertisement, I would've wasted time searching and perhaps even end up with a less suitable replacement. On top of that, advertisements help create jobs. When the demand for products and services increases because of advertising, more people are needed to make and provide those products and services. Consequently, more jobs are created.

Despite its contribution to the economy, advertising can have harmful social effects. This is because advertisements of luxury products like expensive clothes, shoes and cars are very common. It creates the impression that if you possess these things, you become more desirable or impressive to others. Thus, when people cannot buy expensive goods, it often leads to lower self-esteem. In their desperation, they might turn to stealing, or perhaps they will max out their credit cards and put themselves in debt. These effects on people's behaviour are why I'm strongly in favour of restricting the amount of advertisements–particularly ones that target younger people, who are more vulnerable to media influences.

Therefore, even though advertising promotes economic growth, I believe that it should be somewhat restricted to protect people's mental health.

17.移居其他星球

Living on earth would become difficult in the future. So, more money should be spent on researching other planets to live, like Mars.

To what extent do you agree or disagree?

It is predicted by many that Earth will become unsuitable for human habitation in the future. Consequently, some people argue that governments should allocate more financial resources to exploring alternative planets, such as Mars. Personally, I disagree with this view and believe that public funds should be prioritized to address existing issues on Earth.

On the one hand, supporters of space exploration argue that searching for a new home is vital for the long-term survival of human beings. First of all, Earth's natural resources are being rapidly depleted due to overpopulation and excessive industrial development. This has already resulted in a severe shortage of energy and clean water, meaning that our living conditions will inevitably deteriorate. Therefore, researching other planets is a necessary way to find new survival space. Additionally, investment in space projects can stimulate technological progress. The scientific breakthroughs required for space travel, such as advanced solar energy and artificial intelligence, can be applied to improve life on Earth and promote overall human development.

On the other hand, I believe that it is much more rational to spend money on preserving our own planet rather than escaping from it. The primary reason is that current environmental crises, including global warming and pollution, can still be solved if adequate funding is provided. Investing in renewable energy and green technologies is far more effective and practical than spending billions of dollars on searching for an unpredictable future on Mars. Furthermore, public funds should focus on improving the current living standards of ordinary citizens. Today, many countries are still facing urgent challenges such as poverty, inadequate education, and poor healthcare systems. Governments have a responsibility to prioritize citizens' immediate well-being instead of funding distant space ambitions.

In conclusion, although exploring other planets might offer a potential alternative for the distant future and bring some technical innovations, I think it is a misplaced priority. Governments should spend money on saving Earth and helping people live better today.

18.投资科研

Some people believe that a lot of scientific research done today is a waste of time and money.

To what extent do you agree or disagree?

In the modern world, scientific research has become increasingly significant, influencing nearly every aspect of human life. I strongly believe that it is worth investing substantial amounts of time and money, as the benefits of scientific research are undeniable.

One major area where scientific inquiry has proved indispensable is healthcare. Ongoing research drives the development of innovative treatments and life-saving medicines. For example, during the COVID-19 pandemic, scientists worked intensively to develop vaccines that ultimately contained the spread of the virus and saved millions of lives worldwide. Without such breakthroughs, modern healthcare would struggle to address urgent health crises.

Another compelling reason is the advancement of technology. Scientific research has been the foundation for inventions that shape our daily lives. For instance, the internet, which initially emerged as a scientific project, has now become the backbone of the global economy. Moreover, digital devices such as smartphones, laptops, and computers, which stem from scientific progress, have transformed the way people learn, work, and communicate.

Furthermore, research plays a crucial role in tackling global challenges such as climate change, environmental degradation, and energy shortages. For example, scientists have developed renewable energy sources—including solar, wind, and nuclear power—as viable alternatives to fossil fuels, which severely damage the environment. The adoption of these cleaner technologies not only alleviates the pressure on ecosystems but also promotes sustainable development worldwide.

In conclusion, far from being a waste of time or money, scientific research is essential to the progress of modern society. Its contributions to medicine, technology, and global problem-solving demonstrate that continued investment in research is fundamental for building a healthier, more sustainable, and more prosperous future.

19.孩子犯罪父母同罪

Some people argue that parents of children who break the law should be punished in some way, because they are responsible for their children's actions.

To what extent do you agree or disagree?

The debate regarding whether parents should bear legal consequences for their children's criminal actions is highly controversial. While I agree that parents play a crucial role in a child's upbringing and should be held accountable to some degree, I also believe it is unfair to punish them universally, as other external factors contribute to juvenile delinquency.

On the one hand, parents are the primary caregivers and moral compasses for their offspring. If children break the law, it sometimes reflects a severe lack of proper parental supervision or guidance. For instance, if parents turn a blind eye to their children's early misbehaviors, these minor issues can eventually escalate into serious offenses. Therefore, holding parents partially accountable can force them to take their parenting responsibilities more seriously. By being more involved, parents can identify early signs of trouble and nip it in the bud before their children commit actual crimes.

On the other hand, it is unreasonable to place all the blame entirely on parents. As children grow up, they are heavily influenced by the outside world, including peer pressure, social media, and school environments. Even with the best upbringing, teenagers can be led astray by bad company or harmful online content. Furthermore, older children and adolescents are capable of independent thought and must learn to take responsibility for their own actions. Punishing parents for crimes they did not commit or endorse would be unjust and could severely damage the family dynamic.

In conclusion, while parents should face some form of accountability if gross negligence in their parenting is proven, they should not be automatically punished for every crime committed by their children. A fair justice system should evaluate each case individually, considering both the parents' involvement and the external influences on the child.

20.如果有机会不工作

If some people get a chance to choose between life without work in spanning most of the time working, then they would choose not to work.

To what extent do you agree or disagree with this statement?

It is often said that if people had to choose between working all the time and never working, most would choose not to work. While I agree that people want to escape from tiring jobs, I disagree that they would choose to do nothing forever, because work gives us a sense of purpose.

On the one hand, a life without work sounds attractive, especially today when many people are too busy. A lot of jobs are very stressful and take up most of our time. If people did not have to worry about making money, they would certainly want to leave these tiring jobs. Without work, they could spend more time on their hobbies, stay with their families, and travel. These are things that people often have to give up because of their careers. Therefore, wanting to escape from an exhausting working life is a very natural reaction to stress.

On the other hand, never working will not bring true happiness. Work is not just a way to make a living; it also gives us a daily routine, social connections, and a sense of value. Without a job, people often feel empty and bored. Also, solving problems at work gives us a feeling of success that hobbies usually cannot provide. For example, many people who win the lottery or retire early often go back to part-time jobs or start small businesses. They do this not for money, but to feel useful and connected to society.

In conclusion, although most people would hate a life where work takes up all their time, they do not really want to be completely jobless. Humans need goals, achievements, and communication, which are all closely connected to having a meaningful job. So, if given the choice, most people would prefer a balanced life with reasonable work rather than no work at all.

21.广告推销

Some people say that the main aim of advertising is to improve the sales of products that people do not really need.

To what extent do you agree or disagree?

People have different views on whether advertising mainly aims to increase the sales of products which people don't actually need. Although advertising can work that way, I believe that the main purpose of advertising is simply to spread information about a product, regardless of whether it's needed or not.

On one hand, advertising does sometimes aim to improve the sales of products which people don't need. Many advertisements promote luxury products, which by definition are things that aren't necessary for living, even if they may make a person's life more pleasurable. A sports car is a good example of this, as well as luxury handbags, watches, and jewellery. They might increase your social status, but you can definitely live without them. The sales of luxury products depend heavily on advertising because advertisements spread awareness of these items, establishing them as high-class, sophisticated or elegant in the public mind.

Regardless, I would argue that the main purpose of advertising is to provide consumers with information about products and services, many of which fulfil certain needs of consumers. After all, advertisements for luxury goods are outnumbered by advertisements that spread awareness of products necessary for living in some way. An example is a commercial I caught the other day that advertised car insurance. Not all types of insurance are needed, of course, but car insurance is definitely necessary for drivers. Also, I would not have been able to buy a suitable replacement for my broken phone if not for an advertisement I saw recently. Though phones are expensive, they're essential for functioning in modern society.

Thus, while some advertisements aim to improve the sales of unnecessary products, I believe that the primary purpose of most advertising is just to inform consumers about various products and services.

22. 工作闲暇失衡

Many working people do not have enough free time off work to spend with their families and friends.

Why?

What are the effects on family life and society?

In contemporary society, many working people do not have enough free time to spend with their families and friends. This phenomenon is driven by specific social and professional factors, and it brings negative effects on both family life and society as a whole.

There are two main reasons why working individuals struggle to find time for their loved ones. First, the competitive job market pushes people to work longer hours to secure their positions or pursue career advancement. Many employees, especially in fields like technology or finance, feel pressured to take on extra tasks or work overtime to meet high performance standards—fearful that falling behind could lead to job loss. Second, the desire for higher income also plays a role. With rising living costs (such as housing, education, and healthcare expenses), many people choose to work more, or even take on second jobs, to improve their family's financial situation. They prioritize earning more money over leisure time, believing this will provide better security for their families.

The lack of free time for family and friends has harmful impacts on family life first. When people spend most of their time at work, they miss out on important family moments—like their children's school events or family gatherings. This can weaken emotional bonds between family members: children may feel neglected by parents who are rarely present, and couples may grow apart due to lack of communication. Over time, this can lead to family conflicts or even breakdowns. In addition， this trend also affects society negatively. If many families face relationship problems, it can increase social instability. For example, children from families with little parental companionship may be more likely to feel lonely or develop behavioral issues, which could lead to problems like dropping out of school or getting involved in crime later.

In conclusion, the lack of free time among working people is mainly caused by job competition and the need for higher income. It harms family relationships by weakening emotional connections and creates problems for society such as increased instability and pressure on healthcare.

23.再犯罪问题

Many offenders commit more crimes after serving the first punishment.

Why is this happening, and what measures can be taken to tackle this problem?

It is true that many offenders continue to commit crimes even after being imprisoned for their wrongdoing. There are several contributing factors for recidivism among criminals and a number of possible solutions that can be implemented to decrease the likelihood of repeat offenders.

The causes of crimes are complex and manifold. However, the most significant risk factors include poverty, one's inability to obtain employment, and mental health issues aggravated by a brutal and inhumane criminal justice system. Prisoners who are released often have a considerably difficult time reintegrating into society. Not only are they traumatised by the harsh conditions in prison, they are also permanently labelled as a "criminal" and alienated by other members of society, including their family and friends. Furthermore, having a criminal record makes it significantly more difficult to obtain a job, so the employment options for former prisoners are severely limited. This combination of social stigma and lack of employment options can be devastating for former prisoners, leading them back into a life of crime.

Several possible measures can be taken to prevent recidivism. First of all, prisons need to shift their focus from punishment to rehabilitation. All too often, incarceration facilities subject prisoners to unthinkable levels of abuse, violence and deprivation. Mistreatment of inmates causes them to have greater levels of anger and anguish, which may lead them to become mentally unstable and seek revenge on society in the future. In addition, prison-based education programs and job training should be implemented to help prisoners develop the occupational skills they'll need for life after prison. Finally, substance abuse and mental health issues, which are common among prisoners, need to be properly diagnosed and treated to help prisoners reintegrate into society.

In conclusion, it is clear that many criminals continue to commit crimes despite being punished. However, several measures can be taken to effectively combat this issue.

24.了解人们生活的途径

In order to learn the way other people in the world live, it is better to look at film and video records than written documents.

To what extent do you agree or disagree?

To gain a comprehensive understanding of how people live around the world, I believe that written documents are more effective than visual media or moving images. Although visual media can provide an engaging glimpse into different cultures, they often lack the depth and reliability found in written records.

One primary reason written documents are more effective is their higher level of accuracy. Moving images and visual media, including documentaries, are often influenced by commercial and artistic considerations. Directors and producers may choose to dramatize events, simplify complex realities, or focus on stereotypes to appeal to audiences and ensure financial success. These choices can result in a skewed representation of how people truly live. In contrast, written documents such as reports, articles, and academic studies are usually created with a strong commitment to accuracy and factual information. Writers, journalists, and researchers aim to provide a truthful account of events and social practices, making written sources more reliable for understanding different cultures.

Furthermore, written records offer a greater level of detail and context that moving images and visual media cannot match. For example, academic studies, ethnography, and research papers provide thorough analyses of social, economic, and cultural dynamics, while personal memoirs and travelogues can offer intimate perspectives on everyday life that are rarely captured in visual media. Moving images and visual media, due to time limitations and the need to maintain viewer interest, often condense or omit many intricate aspects of life to focus on the most visually compelling scenes. This compression can lead to a superficial understanding, missing the subtler aspects of how people live, work, and interact within their cultural contexts.

In conclusion, I maintain that written documents are a more effective tool than moving images and visual media for understanding the way people live around the world. They offer greater accuracy, depth, and context, while visual media often fall short due to their tendency to prioritize entertainment over factual representation. For a more complete and nuanced understanding of different cultures, written records are indispensable.

25.动植物种类变少

Many species of animals and plants are in danger of becoming extinct.

What are the causes of this problem.

What can be done to prevent it from happening?

Give reasons for your answer and include any relevant examples from your knowledge and experience.

Write at least 250 words.

In recent decades, a growing number of animal and plant species have been pushed to the brink of extinction. This issue is largely the result of human activities, but there are several practical measures that can be taken to address it.

One major cause of species loss is the destruction of natural habitats. As cities expand and agricultural land increases, forests, wetlands and grasslands are cleared on a massive scale. Many animals lose their shelters and food sources, while numerous plant species disappear because the conditions they need to survive no longer exist. Another key factor is pollution. Chemicals from factories, plastic waste and contaminated water have damaged ecosystems and poisoned wildlife. For example, many marine species have died after ingesting plastic or becoming trapped in fishing nets. In addition, climate change has altered temperatures and rainfall patterns, disrupting migration routes and breeding cycles for many species. These environmental changes happen so quickly that most animals and plants cannot adapt in time.

Despite the seriousness of this problem, several solutions could help protect endangered species. First, governments should strengthen environmental regulations and enforce strict penalties for illegal activities such as logging, poaching and overfishing. Protecting natural habitats through national parks and conservation zones is an effective way to give species a safe place to live and reproduce. Second, public awareness campaigns can encourage people to reduce pollution and adopt more sustainable lifestyles. When individuals understand how their daily habits affect wildlife, they are more likely to recycle, reduce waste and support conservation efforts. Finally, scientific research and breeding programmes can play an important role. By studying endangered species and breeding them in controlled environments, scientists can help increase their populations before releasing them back into the wild.

In conclusion, the extinction of many species is mainly caused by habitat loss, pollution and climate change. However, with stronger laws, better public awareness and scientific intervention, it is possible to slow down or even reverse this trend. Protecting biodiversity is essential not only for wildlife but also for the health of the planet and future generations.
